14

CLAIMS

- 1 Method making it possible to detect and/or to avoid the modification of software embedded in a programmable memory within a system comprising a hard kernel containing hardware security functions suitable for verifying the integrity of a soft kernel comprising a programmable memory, the system comprising a local data interface, characterized in that it comprises at least the following steps:
- A1 the signal received on the local data interface is not valid, place the system in a disabled state,
- B1 the signal received on the local data interface is a disconnection signal, or there is no signal, instigate a secure startup procedure, with execution of the control functions:

Auto test of the hard kernel:

- If the auto test is OK, then test the integrity of the reprogrammable memory,
 - If this integrity is OK, then activate the system for normal operation
 - o If this integrity is KO, then place the system in a disabled state
- If the auto test is KO, then place the system in a disabled state,
- C1 the received signal is a valid startup signal,
 - If the system is in a development mode, render it enabled,
 - If the system is in an enabled utilization mode and if the signal is a test signal, then deactivate at least one of the essential functions of enabled operation.
- 2 Method making it possible to detect and/or to avoid illicit modifications of manufacturer software within a GSM-type system, comprising a hard kernel and a soft kernel, a local data interface, comprising at least the following steps:

- A2 the signal received on the local data interface of the terminal is not valid, place the GSM terminal in a disabled state,
- B2 the signal received on the local data interface is a disconnection signal, or there is no signal, instigate a secure startup procedure, with execution of the control functions:

Auto test of the hard kernel

- If the auto test is OK, then test the integrity of the soft kernel
 - If this integrity is OK, then activate the terminal for normal operation,
 - If the integrity is KO, then place the terminal in a disabled state,
- If the auto test is KO, then place the GSM terminal in a disabled state.

C2 - the received signal is a valid startup signal:

- · If the fuse is not blown, render the GSM terminal enabled,
- If the fuse is blown, render the terminal not totally enabled, by deactivating at least one of the enabled functions of the terminal:
 - If the signal is a signal of JTAG test type, continue the test procedure,
 - If the signal is a test signal, start up in nonsecure mode and continue the test procedure.
- 3 Method according to one of Claims 1 and 2, characterized in that the exchange of the data between the hard kernel and the soft kernel is performed by using an algorithm based on the principle of non-replay and of nonpredictability of the transmitted data.
- 4 System making it possible to detect and/or to avoid the modification of software embedded in a programmable memory comprising a hard kernel containing hardware security functions and a soft kernel comprising a programmable memory, a local data interface able to receive signals, characterized in that it comprises means suitable to:

- place the system in a disabled state when the signal received on the local data interface is not valid,
- for a disconnection signal received or an absence of signal on the local data interface, instigate a secure startup procedure, with execution of control functions:

Auto test of the hard kernel:

- If the auto test is OK, then test the integrity of the programmable memory,
 - o If this integrity is OK, then activate the system for normal operation
 - o If this integrity is KO, then place the system in a disabled state
- If the auto test is KO, then place the system in a disabled state,
- > For a received signal is a valid startup signal.
- If the system is in a development mode, render it enabled,
- If the system is in an enabled utilization mode, and if the signal is a test signal then deactivate at least one of the essential functions of enabled operation on startup.
- 5 System according to Claim 4, characterized in that it comprises means of securing the data exchanges between the hard kernel and the soft kernel.
- 6 System according to Claim 4, characterized in that the system is a GSM terminal.
- 7 System according to Claim 4, characterized in that the system is a micro-computer.
- 8 System according to Claim 4, characterized in that the system is an MP3type reader containing a reprogrammable memory.
